

The purpose of this project is twofold:

- Develop an I2C Driver for the RP2040 chip capable of polling, interrupts, and DMA.
- Develop a driver for the BMP280 sensor

The end-product should not use any of the pico SDK nor any available BMP280 driver. This includes tooling such as linker scripts, firmware, bootloader, etc. The goal is to build an entirely self-sufficient I2C/sensor software product. Cmake will be used for builds, clang for compiling, Gtest/Gmock for testing, and git for project management.
